Welcome

Every parent or carer wants to know what to do when a child is ill. This handbook will help you to care for your child at home, to know when to call the GP and when to contact the emergency services.

Most of the problems you will come up against are simply an everyday part of growing up, which can be helped with a chat with your health visitor or midwife. Almost all babies, toddlers and children aged up to five will also get the most common childhood illnesses like chickenpox, colds, sore throats and ear infections. While these are not very nice at the time they are easy to treat with a visit to your GP and then cared for at home.

This handbook has been put together with help from doctors. If you are worried you must get further advice. Trust your instincts, you know your child better than anybody else.

More often than not something that can seem quite serious, like a high temperature, can be put down to a cold, which can often be sorted out with a quick trip to your local pharmacy. It is so easy to panic and rush your child to Accident & Emergency (A&E) when they might just have a simple cough or cold which can be treated at home. If you are worried, you must of course go and see your GP – but it’s worth finding out a little more about the common, everyday illnesses so you know what to do and where to go to get help.

About us

Birmingham South Central Clinical Commissioning Group

Birmingham South Central Clinical Commissioning Group (BSC CCG) is led by GPs, nurses and other health professionals and is responsible for buying healthcare services for approximately 250,000 people in the south and centre of the city. BSC CCG is a membership of 47 GP practices.

Birmingham CrossCity Clinical Commissioning Group

Birmingham CrossCity is a clinically-led organisation with the aim of improving health and health care within our local communities and across the city of Birmingham, based on the best available understanding of the health needs of our population.

Both these CCG organisations are experienced clinicians who work together to deliver the best services for Birmingham and provide local, accessible options to access healthcare in a variety of settings.
Parents are usually good at noticing when something is wrong with their baby from quite early on. It is normal to worry that you won’t recognise the signs that your baby is unwell. Trust your instincts, you know your baby best.

Learn how to spot the signs of serious illness and how to cope if an accident happens. If you know the basics and you are well prepared, you will find it easier to cope and less scary. Keep a small supply of useful medicines somewhere up high where a child cannot reach them. There is a useful list of things to have at home just in case in the box on the right. Make sure you’ve got the right strength of medicine for the age of your child, always follow instructions carefully and check use by dates.

If your baby seems to have a serious illness it’s important to get medical attention as soon as possible.

Think

Be prepared so that if they do become unwell you will know what to do and whom to contact.

Stop

I have a new baby at home and I am worried I won’t know what to do or what to look out for.

Do

Keep a small supply of useful medicines. Keep emergency numbers in a place you can find them.
This information cannot replace specialist treatment. If you are still worried, contact NHS 111 or a doctor (e.g. your GP or Walk-in Centre).

Pharmacist’s tip
Keep a small supply of useful medicines. Include things like:

- Thermometer *(See page 6)*
- Plasters
- Liquid painkillers *(e.g. baby paracetamol)*
- Barrier cream
A guide to services

Choose well.
Midwife
Your midwife will know you and your baby well. They offer support and advice during pregnancy and the early days and can tell you where to get extra help if you need it.

Health Visitor
Your health visitor is there to support you until your child is 5 years old. They will visit you at home or see you in a clinic and can offer support and advice and point you in the right direction for additional help if you need it. They are part of a team of nurses and nursery nurses who are there to support you during the early years.
Crying
Understanding why your baby cries

All babies cry, especially in the first few weeks after birth. Crying is their way of letting you know they need something or are uncomfortable. They may need their nappy changing, they may be hungry or just need a cuddle. Always burp your baby after a feed as this will help to get rid of their wind and make them more comfortable.

If your baby cries suddenly and often, but they otherwise appear to be happy and healthy, they may have ‘colic’. Colic is common and although uncomfortable, it is not serious and usually affects babies only in the first few months of their lives. The most common symptom of colic is continuous crying, which typically occurs in the late afternoon or evening. Other signs include a flushed appearance, drawing their legs to their chest, clenching fists, passing wind and trouble sleeping.

When a baby cries, it can be upsetting. It is very important to stay calm and don’t be afraid to ask for help.
NHS 111 says

If your baby’s crying seems different in any way (such as a very high-pitched cry or a whimper), then seek medical advice. Crying can sometimes be a sign that your baby is unwell. Trust your instincts – you know your baby best. If in doubt, call NHS 111 where you can speak to a trained nurse.

Health visitor’s advice

Finding out why your baby is crying is often a matter of going through all the possible options.

Things to check first are:

• Does their nappy need changing?
• Could they be hungry?
• Could they be too hot?
• Could they be too cold?

These are simple things which could be causing your baby to cry.
Nappy rash

A common problem that’s easy to treat

Nappy rash is very common and can affect lots of babies. It is usually caused when your baby’s skin comes into contact with wee and poo that collects in their nappy.

A nappy rash causes your baby’s skin to become sore. The skin in this area may be covered in red spots or blotches. You might need to change their nappy more often.

Most nappy rashes can be treated with a simple skincare routine and by using a cream you can get from the pharmacist. With a mild nappy rash, your baby won’t normally feel too much discomfort.

However, some nappy rashes are more serious and can be caused by something else. A bad rash will be more upsetting for your baby, and may need medical treatment. Talk to your health visitor if the problems continue.

Stop

There is a red, sore rash around the nappy area. Baby is uncomfortable and cries a lot.

Think

Has your baby been in a dirty nappy for a long period of time?

Do

Change their nappy often. Speak to your health visitor and ask your pharmacist about creams.
Pharmacist’s tips
Call in and chat to us about creams we can provide you with.

There are two types of nappy cream available. One is a barrier cream to keep urine away from your baby’s skin. The other is a medicated cream, that is good for clearing up any soreness but should only be used when advised by a health professional.

Health visitor’s advice

- Leave your baby in a warm, safe place with no clothes or a nappy on, to let the air get to their skin.
- Use a barrier cream (see pharmacist’s tips below).
- Remember to change and check their nappy often.

This information cannot replace specialist treatment. If you are still worried, contact a pharmacist or your health visitor.
Rashes and dry skin

Baby skin needs extra care

A baby’s skin is thinner and needs extra care. Dry, flaky skin, some blemishes, blotches and slight rashes are normal in newborns and will naturally clear up. If your baby is otherwise well but has a rash you are worried about contact your midwife or health visitor. Another common rash for babies is heat rash. This mainly appears on the head and neck as tiny red spots and is nothing to worry about. Keep them warm but not hot and try to dress them in natural cotton clothes, with nothing that can rub on their skin.

Your baby may also suffer from something called Cradle cap. This is the name given to the yellowish, greasy, scaly patches on the scalp of newborns and usually appears in the baby’s first three months. It can look like a bad case of dandruff and is harmless, it doesn’t cause any irritation to your baby and usually clears up by the time they are two years old.

Stop

Your baby’s skin may be flaky and dry.

Think

Dry skin is common in newborn babies, as their skin is 15 times thinner than that of an adult.

Do

Avoid soap and using products on your baby’s skin. Wash in clean water.
Health visitor’s advice

Baby skin is more delicate than ours. Try to limit the amount of products you use on their skin and never leave your baby out in the sun (see sun safety pages 42-43).

Cradle cap needs no specific treatment, although gently washing the baby’s hair and scalp may stop build-up of the scale. Use just a small amount of a pure, natural oil – such as olive oil or vegetable oil – on your baby’s scalp and leave it on for at least 15 minutes before washing it off.

Doctor’s tips

Contact your GP or go to A&E immediately if your baby has a rash that does not disappear when you press a glass to it. This may be a sign of meningitis and needs to be seen by a doctor no matter how well your baby seems.

Seek immediate advice if your baby has a rash and a high temperature or vomiting (see page 30 for more information on meningitis).
Sticky eyes

Common in newborn babies

Sticky eyes are common in newborn babies and young children while their tear ducts are developing. You may see some sticky stuff in the corner of the eyes or their eyelashes may be stuck together.

It normally clears up on its own, but you may have to clean your baby’s eyes regularly with damp cotton wool. Use clean, cooled boiled water and wipe each eye from the corner by the nose outwards. Use a clean piece of cotton wool for each wipe.

The signs of sticky eyes can sometimes be confused with an infection called conjunctivitis. With conjunctivitis the signs are a yellow, green sticky goo which comes back regularly. If you notice this, contact your health visitor or GP. This can be passed on easily, so wash your hands and use a separate towel for your baby.

Health visitor’s advice

Cooled boiled water is the best option for cleaning a newborn baby’s eyes.

Wipe each eye from the corner by the nose outwards. Use a clean piece cotton wool for each wipe. Remember to wash your hands before and afterwards and avoid sharing towels to prevent spreading infection.

Stop

Is there discharge in the corner of your baby’s eye and do their eyelashes appear to be stuck together?

Think

Sticky eyes is a common condition that affects most babies; speak to your health visitor.

Do

Use cooled boiled water on a clean piece of cotton wool for each wipe.
This information cannot replace specialist treatment. If you are still worried, contact NHS 111 or a doctor (e.g. your GP or Walk-in Centre).
A baby’s first teeth (known as milk teeth) usually develop before your baby is born.

Teeth generally start to show when a child is four to nine months old, although every baby develops at their own pace. This is known as teething. Some babies show few signs while others find it more uncomfortable – they get hot, red cheeks, dribble a lot, are not hungry, seem a bit grumpy and chew on everything.

There are ways you can help make teething easier for your baby. Every child is different, and you may have to try a few things until you find one that works for your baby. Try teething gels and teething rings and talk to the pharmacist for advice.

Now is a good time to think about your child’s tooth care routine. You can brush their teeth with a soft baby toothbrush and baby toothpaste and take them with you when you are going to the dentist.

**Health visitor’s advice**

Teething rings give your baby something to safely chew on, which may help to ease their discomfort or pain. Some teething rings can be cooled first in the fridge.

It can help to give your baby something hard to chew on, such as a teething ring, a crust of bread, a breadstick or a stick of peeled carrot (stay nearby in case of choking).

*Source: NHS Choices.*
This information cannot replace specialist treatment. If you are still worried, contact a pharmacist or your health visitor.

Pharmacist’s tips

If your baby is uncomfortable, you may want to give them a medicine which has been made for children which you can buy from the pharmacist. These medicines contain a small dose of painkiller, such as paracetamol, to help ease any discomfort. The medicine should also be sugar-free. Make sure you read all instructions or ask your pharmacist about how to use them.
Chickenpox

Most children will catch it

Chickenpox is a mild disease that most children catch at some point. It takes 10-21 days for the signs to show. If you are sure your child has chickenpox you do not need to go to your GP unless your child is very unwell.

Chickenpox is most common in children who are between two and eight years old. They can pass it on to others from about two days before the rash appears until roughly five days after. The rash usually appears on the chest and back. You and your child should stay away from other people until all of the blisters have fully burst and dried which usually happens five to seven days after the first blister appears. You can take them out if they are well enough, but be careful to keep away from other people. After the last blister has burst and dried, they are no longer likely to pass the infection on.

Chickenpox spreads from spit, sneezes and coughs from a person who has chickenpox.

Symptoms include a fever for more than five days, not drinking well, developing a cough or breathing difficulties, and confusion or fits.

Health Visitor says

It is important to keep them cool, itching gets worse if they are hot. Try calamine lotion or anti-histamine medication (especially at night) to help stop them itching and scratching the blisters which could cause scarring.

Stop

Do they have an itchy rash (looks like blisters) mainly on the chest and back?

Think

Chickenpox is a common illness among children, particularly those under eight years old.

Do

Stay away from others until the blisters have dried. Call NHS 111 for advice on how to care for your child.
Doctor’s advice

After having chickenpox, the virus stays in the body. Later in life the virus can come back in a different form known as shingles.

Chickenpox is easy to pass on to someone who has not had it before. If your child has chickenpox keep them away from others.

If you are pregnant it is likely that you are immune to chickenpox. However, please contact your midwife for advice.
Coughs and colds
A cuddle can go a long way

There are some good things about children catching a few coughs and colds, as it helps them to build up natural defences and fight off viruses.

Most bugs will run their course without doing any real harm because they are viruses which get better on their own, but, there are things you can do at home to help:

• Give your child lots to drink.
• Try infant paracetamol (not aspirin).
• Keep them away from smoke, do not let people smoke at home or around your child or come into contact with your child if they have recently smoked.
• Keep calm – a cuddle goes a long way.
• Talk to your pharmacist but remember that coughing is the body’s way of keeping the lungs clear.

**Catch it**

Germs spread easily. Always carry tissues and use them to catch coughs or sneezes.

**Bin it**

Germs can live for several hours on tissues. Dispose of your tissue as soon as possible.

**Kill it**

Hands can pass on germs to everything you touch. Clean your hands as soon as you can.
Pharmacist’s tips

Children can also be treated using over the counter painkillers to help to bring down a raised temperature. Some are available as a liquid for children and can be given from the age of about three months. Check with the pharmacist and tell them how old your child is. Always check with your pharmacist if you aren’t sure which treatments you can give your child.
Ear problems

Babies’ ears need to be treated with care

Babies may develop some sort of ear problem at certain times. Most children have grown out of ear infections by the age of seven. Most ear infections are caused by a virus which will get better by itself and will not need antibiotics.

Babies have some natural protection against infections in the first few weeks; this is boosted by breastfeeding. In babies and toddlers, bacteria pass from the nose to the ears more easily. Ear infections can be painful and your child may just need extra cuddles and painkillers from the pharmacist. Your child may have swollen glands in their neck – this is the body’s way of fighting infection.

Children who live in households where people smoke (passive smoking) or who have a lot of contact with other children, like those who go to nursery, are more likely to get ear infections. Speak to your health visitor about safely cleaning your baby’s ears as they can be easily damaged.
What are the signs of an ear infection?
The signs are a raised temperature, general irritability and pain or discomfort. They may even have a pus-like discharge, which can also be associated with a blocked feeling in the ear or hearing loss. Although most ear infections settle down without any serious effects, there can be mild hearing loss for a short time (two to three weeks).

Health visitor’s advice
- Babies’ ears need to be treated with care when cleaning.
- Never use a cotton bud inside your child’s ear.
- If they have a temperature, wax may flow out.
- Use different, clean damp cotton wool on each ear to gently clean around the outer area.

This information cannot replace specialist treatment. If you are still worried, contact NHS 111 or a doctor (e.g. your GP or Walk-in Centre).
Being sick

A problem likely to get better on its own

It’s common for babies to be sick in the early weeks as they get used to feeding and their bodies develop. You can tell when your baby is vomiting, rather than just bringing up small amounts of milk, because there will be a lot more coming out. It can be frightening for your baby, so they are likely to cry. Lots of things can cause your baby to be sick.

Being sick often, or lots of it, may be due to ‘gastric reflux’ where acid from the tummy can come up again. Babies can be grumpy and it can sometimes lead to poor feeding. If your baby is feeding well but doesn’t seem themselves, you may just need to change the baby’s position during a feed to make them more upright. Feeding smaller amounts and more often may also help.

Health visitor’s advice

‘Possetting’ is when a baby brings up small amounts of milk. This is very common in the first few weeks and may be nothing to worry about. If you are worried get advice.

Stop

I have a new baby. I have just given my baby a feed.

Think

They always seem to bring up small amounts of milk. This is known as ‘possetting’. As they develop it will stop naturally.

Do

Talk to your health visitor.
Health visitor’s advice

After the first few months, if your baby is suddenly sick it is more likely to be caused by a stomach virus rather than possetting. Gastroenteritis is a tummy bug (see upset tummy page 32), which can come with diarrhoea (runny poo).

Contact your health visitor or NHS 111 where you can speak to a trained nurse.
Fever

Over 38°C means a fever

A normal temperature is between 36-36.8°C (96.8-98.24°F). In children, any temperature of 38°C (100.4°F) or above is considered high and is classed as a fever. To find out if your child has a fever, there are different kinds of thermometers, including digital thermometers, ear thermometers and skin-strip thermometers (see page 6 for more information).

A baby can’t regulate their own body temperature and can easily get too hot. Teething can also cause a slight rise in temperature and it is common for babies and children to get a fever within 48 hours of being immunised. Whenever a baby or toddler has a high temperature, keep an eye out for any developments.

There are certain times when your child should see or contact a GP:

- If your baby is under three months and has a temperature of over 38°C (100.4°F) or is three to six months and still has a temperature higher than 39°C (102.2°F) an hour after they have taken the correct dose of infant paracetamol.
- If they are being sick without diarrhoea, or develop a rash as well as a fever.
- If they drink less than usual, wee less than usual and are unusually sleepy.
- Being unwell for some time.

Parents and carers should:

- Offer regular fluids (if breastfeeding, continue this as normal).
- Check the child regularly, including during the night (two to three times).
- Dress the child appropriately for their surroundings, with the aim of preventing overheating or shivering.
- Keep the child away from nursery or school while the fever persists, and notify the nursery or school of the illness.
Doctor’s advice
Seek medical help if your child:
• Is dehydrated (signs include drier nappies and weeing less, dry mouth, sunken fontanelle, absence of tears, sunken eyes and poor overall appearance).
• Has a fit.
• Develops a non-blanching rash i.e. the rash doesn’t disappear when pressed.
• Has a fever that lasts longer than five days.
• Is getting more unwell.

This information cannot replace specialist treatment. If you are still worried, contact NHS 111 or a doctor (e.g. your GP or Walk-in Centre).
Taking your child’s temperature

**Digital thermometers** are quick to use, accurate and can be used under the arm (always use the thermometer under the arm with children under five years old). Hold your child’s arm against their body and leave the thermometer in place for the time stated in the instructions.

**Ear thermometers** are put in the child’s ear. They take the temperature in a few seconds and do not disturb the child, but they can be expensive. Ear thermometers may give low readings when not correctly placed in the ear, so always make sure you read the instructions carefully.

**Strip-type thermometers**, which you hold on your child’s forehead, are not always an accurate way of taking their temperature. They show the temperature of the skin, not of the body.

**Mercury-in-glass thermometers** haven’t been used in hospitals for years and are no longer available to buy.

Source: NHS Choices.
Meningitis is a swelling around the brain. It’s a very serious illness, but if it’s treated early most children make a full recovery.

You should always treat any case of suspected meningitis as an emergency.

Early signs may be like having a cold or flu. Children with meningitis can become seriously ill very fast, so make sure you can spot the signs. Your child may have a cluster of red or purple spots, and if so do the glass test (see opposite page). This rash can be harder to see on darker skin, so check for spots over your baby or child’s whole body as it can start anywhere (check lightest areas first).

The presence of fever and any other of the above symptoms should be taken extremely seriously. Not all children will show all the signs listed below.

Meningitis is a swelling around the brain. It’s a very serious illness, but if it’s treated early most children make a full recovery.

You should always treat any case of suspected meningitis as an emergency.

Early signs may be like having a cold or flu. Children with meningitis can become seriously ill very fast, so make sure you can spot the signs. Your child may have a cluster of red or purple spots, and if so do the glass test (see opposite page). This rash can be harder to see on darker skin, so check for spots over your baby or child’s whole body as it can start anywhere (check lightest areas first).

The presence of fever and any other of the above symptoms should be taken extremely seriously. Not all children will show all the signs listed below.

**Doctor’s advice**

Look and learn about the signs below; if any are present contact a GP:

- Fever, cold hands and feet
- Floppy and unresponsive
- Drowsy and difficult to wake
- Spots/rash. Do the glass test
- Rapid breathing or grunting
- Fretful, dislikes being handled
- Unusual cry or moaning

**Stop**

Is your child showing signs like those in the box below?

**Think**

You should always treat any case of suspected meningitis as an emergency.

**Do**

Do the glass test.

If spots do not change colour treat as an emergency and get help now.
The glass test
The glass test is a really useful way of spotting suspected meningitis. If your child has a cluster of red or purple spots, press the side of a clear drinking glass firmly against the rash.

Go straight to Accident & Emergency
In this example the spots are still visible through the glass. Contact a doctor immediately (e.g. your GP or Urgent Care Centre). If you cannot get help straight away go to Accident & Emergency.

In this example the spots under the glass have virtually disappeared. It is unlikely to be meningitis but if you are still worried contact NHS 111, your GP or go to Accident & Emergency.

If you are worried, contact a doctor (e.g. your GP or Walk-in Centre). If you cannot get help straight away go to Accident & Emergency.
Upset tummy

Not nice for you or your baby

Sickness and diarrhoea bugs are caught easily and are often passed on in places where there are lots of children – like playgroups or nurseries.

Feeling sick and suddenly being sick are normally the first signs. Diarrhoea (runny poo) can follow afterwards. Take them to see your GP if they are unwell for longer than 24 hours or sooner if they are newborn or if you notice signs of dehydration.

If you’re breastfeeding, keep on doing so. Offer older children plenty of water, or an ice-lolly for them to suck. If they want to eat, give them plain foods like pasta or boiled rice (nothing too rich or salty).

Keep them away from others who may pick up infection. Be extra careful and make sure everyone washes their hands regularly.

Signs of dehydration

• Sunken fontanelle (i.e. the soft spot is more dipped in than usual).
• Less wet nappies (i.e. they wee less).
• More sleepy than usual.
• Runny poo.
• Dry mouth.

Stop

Your child is being sick and/or has runny poo.

Think

To help, get them to drink lots. They most probably have a tummy upset.

Do

Go to your GP if they are unwell for longer than 24 hours. Keep them away from others.
Pharmacist’s tips
There are lots of ways you can care for your child at home. Things to try are:
• Give them regular drinks – try small amounts of cold water.
• Be extra careful with hand hygiene (use soap and water and dry hands well with a clean towel).
• Rehydrating solutions come in pre-measured sachets to mix with water. It helps with dehydration.

If your child is unwell for more than 24 hours see your GP. If your baby is newborn or very unwell contact your GP straight away.

If you are still worried, contact a pharmacist or a doctor (e.g. your GP or Urgent Care Centre/Walk-in Centre).
Wheezeing and breathing difficulties

Look at the signs

Any kind of breathing difficulty your infant or child experiences can be scary for parents. It may be nothing to worry about and could just be normal baby ‘snuffles’.

**Use your instincts with newborns and babies.**

It could be:

- Rapid breathing or panting, which is common. If there is no other sign of illness, it comes and goes and your baby is breathing comfortably most of the time, there’s normally no need to worry.
- Breathing may sound a bit rattly. Try holding your baby upright and letting them sleep upright in your arms.
- Occasional coughing or choking which may occur when a baby takes in milk too quickly with feeds. Try to slow things down a bit.
- A cold or mild cough. Keep an eye on them at this stage and use your instincts.

If you are worried talk to your health visitor or call NHS 111.

**Health visitor’s advice**

Make sure your baby or toddler has not swallowed something they should not have like a plastic toy. If this happens and they appear to be choking get help straight away.

**A midwife’s advice**

Newborns often have unusual breathing patterns and most babies have a stuffy nose for the first several weeks of life. Newborn babies breathe much faster than older children.
In older babies and toddlers you may notice:

- Coughing, runny nose, or mild temperature – (see page 24 coughs and colds).
- Croup (hoarse voice, barking cough) needs to be assessed by a GP and may need treating with steroids.
- Their lips and nose appear a blue colour.

While you are contacting your GP try sitting with them in a steamy bathroom – do not leave your child alone.

If you’re worried about your child wheezing or having breathing difficulties even after reading this, contact a GP immediately.

Doctor’s advice

You need to get advice immediately if your baby or toddler:

- Seems to find breathing hard work and they are sucking in their ribs and tummy.
- Their chest looks like it is ‘caving in.’
- Their skin turns a blue colour, especially lips and nose.
- They are unable to complete a full sentence without stopping to take a breath.
Bumps and bruises
Part of growing up

Minor cuts, bumps and bruises are a normal part of growing up. Allowing them to explore the world around them (with supervision) helps them develop and learn. Most of your toddler’s bumps will require no more than a cuddle to make them better. You will quickly be able to tell by the noise of the bang, the reaction of your child and the colour of the area affected which are the more serious bumps.

If it looks like the bump may swell, use a cold flannel (soaking the cloth with cold water) or ice pack (but don’t put ice directly onto the skin) to help reduce swelling and to cool the area for at least a few minutes.

If your child has had a bump to the head and it looks serious, or symptoms worsen, call NHS 111. Read the information on the right.

If your child is under a year old and has a bump on the head please seek advice from a GP.

Keeping them safe
Being a toddler means they are discovering the world around them. This can result in bumps and bruises. It is almost impossible to prevent every accident although there are things we can do at home which might help. Think about safety gates, corner cushions for sharp furniture, cupboard locks, fire guards, window locks and non slip bath mats.

Remember to keep hot drinks out of children’s reach.
If you are still worried, contact a doctor (e.g. your GP or Walk-in Centre). If you cannot get help straight away go to Accident & Emergency.

Head injury
One of the signs of a severe head injury is being unusually sleepy, although this does not mean you cannot let your child sleep.

You need to get medical attention if:
• They are vomiting.
• They are complaining it hurts.
• They are not responding at all.

If they are tired from what’s happened, or from crying, then it is fine to let them sleep. If you are worried in any way about their drowsiness, then you should wake your child an hour after they go to sleep.

Check that they are okay, and that they are responding normally throughout the night.
Healthy lifestyles
Start healthy habits early in life

With healthy habits from birth, you can give your baby a good start for a healthy and happy future. Breast milk is ideal for your baby’s growing needs and giving them breast milk can make a big difference. If you are not as healthy as you could be, now could be a great time to establish good healthy habits for all the family.

Babies like the foods they get used to. If you give them lots of different, healthy foods to try when they are babies and toddlers, they are more likely to eat a variety of healthy foods as they grow up.

Being active takes brain and muscle power, so it plays an important part in your baby’s development. As they grow, you can help them by playing with them and helping them make new movements and explore their surroundings. The whole family can enjoy a healthy lifestyle together.

Health Visitor says
Smoking at home can lead to health problems. This is called passive smoking and it means you are forcing your child to breathe in your smoke. Even if you smoke outside it can still damage their health. If you or your partner smoke, never share a bed with your child.

If you want to give up smoking, visit www.smokefree.nhs.uk

Stop
Do you drink too much alcohol, take drugs or smoke?

Think
You may be passing these habits onto your child. Now is the time to get healthy together.

Do
Get help if you need it from NHS websites and speak to your GP.
Here are some basic rules to follow to help you lead a healthier lifestyle:

• Your good health habits will become your child’s good health habits.
• Keep active together.
• Drink alcohol with caution, and know the limits.
• Do not smoke or take drugs, or if you do, get help to give up.
• There are vitamins and healthy food vouchers available. These are sometimes free.
• Eat lots of fruit and vegetables.
Immunisations, also known as vaccinations, are usually given by injection. Children in the UK are offered vaccinations against a variety of diseases as part of the Healthy Child Programme. You can get advice on the vaccinations from your family GP or health visitor. A record is kept in the Parent Held Child Health Record (Red Book), which is a book you keep containing information on your child’s health.

Immunisations are mainly given during the first five years. It’s important to have vaccinations at the right age to keep the risk of disease as low as possible. It is normal to worry about vaccinations, so don’t hesitate to ask your health visitor or GP for advice – that's what they are there for! Childhood immunisations are free and most are given at your GP’s surgery.

Some immunisations are given more than once, to make sure the protection continues. This is known as a booster, so make sure your child gets it.

**Immunisation begins at two months, when baby’s natural immunity to illness begins to drop.**

**Think**

Immunisations don’t just protect your child during childhood, they protect them for life.

**Do**

Your health visitor will tell you when local immunisation sessions are taking place.
Doctor’s advice

Immunisations are used to protect children from diseases which can be very serious and sometimes even cause death.

The protection immunisations offer your child are worth the small amount of pain.

It is important your child’s vaccinations are kept up-to-date.

Health visitor’s advice

Make sure you keep your child’s Red Book in a safe place. It is your only complete record of their childhood immunisations and they are often needed later in life.

NHS 111 says

If you have any questions or concerns about childhood immunisation and vaccines in the UK, then call NHS 111 or visit www.nhs.uk
Sun safety

Fresh air is great, but the sun can burn

Keep your child cool and protect them from the sun and heat. Babies under six months should be kept out of direct sunlight and older children should be allowed in the sun for a limited time and be well protected. Stay out of the sun, especially during the middle of the day. All types of skin, fair or dark, need protection.

Attach a sunshade to the pushchair to keep them out of direct sunlight. A sunhat, with a wide brim or a long flap at the back, will protect your child’s head and neck from the sun. Hair does not stop the head from burning. Apply suncream regularly, particularly if your child is in and out of the sea or a paddling pool.

If your baby is over six months old, encourage them to drink water. Try giving them tiny pieces of ice and fruit juice lollies. For older toddlers and children, plenty of fruit will also help to keep their fluid levels up.

Skin specialist says

There are over 69,000* new cases of skin cancer (melanoma) treated each year in the UK. Cancer groups are working together to tell us about sun damage from an early age. As parents we can take simple measures to protect our children. Remember, babies and toddlers are not interested in tanning and sunburn can cause damage to their skin.

Pharmacist’s tips

The higher the SPF (Sun Protection Factor), the better protection it is for the skin. You should use a complete sunblock on your baby or toddler. SPFs of up to 60 are available and these block out almost all of the sun’s rays. Even with suncream, keep them in the shade whenever you can and make sure newborn babies are never in the sun. Don’t forget to protect their eyes with sunglasses you can buy from the pharmacist.
Safer sleeping

Where will your baby be sleeping tonight?

The safest place for your baby to sleep is always in their cot. ‘Safe sleeping’ means always putting your baby safely in the cot for every sleep. This includes after night time feeding and for daytime naps. Remember, the cot is not just for night time!

It’s easy to get into the habit of feeding your baby on the sofa or in bed and then inadvertently falling asleep, however you may accidentally smother your baby in this situation. This risk is greater if you have drunk alcohol, or taken any drug which slows your response to your baby. Babies can be smothered when sleeping on a sofa or bed, either alone or with you. Rolling into cushions, bedclothes or pillows can severely restrict baby’s breathing – as you can too if you sleep on the sofa or bed with your baby. **Never put your baby to sleep on the sofa or in your bed!**

Take note of the following which will help to reduce accidents:

- Sleep baby in their cot in your room until they are 6 months old
- Place baby on their back in the cot when putting them to sleep
- Make sure their feet are at the bottom of the cot which prevents them suffocating under the covers
- Ideal room temperature is between 16-20 degrees centigrade
- Don’t drink or take drugs if you are feeding or cuddling your baby
- Don’t smoke near your baby
- Don’t share a bed with your baby if you have been drinking alcohol, taken drugs or medication or are very tired
- Don’t ever sleep with your baby on a sofa or armchair
Health visitor’s advice

Cot deaths and deaths from smothering are rare, but the risk is increased if baby is not put to sleep in the right way. Always put them half way down their cot and check the temperature of the room is correct.

Doctor’s advice

If you are on medication, drink alcohol regularly or take drugs then stop and think – you may be putting your baby at risk. Seek advice from your doctor and ensure that accidents don’t happen.
Emotional wellbeing

Each new developmental stage is likely to present new challenges for you and your child. It is helpful to think about children’s stages of development, rather than a specific age that your child may learn a particular skill. Being nurturing and reacting positively towards your child and ignoring unwanted behaviour contributes to forming a health environment along with praise and rewards for good behaviour.

Children need consistency and regular routines order in to feel listened to. Providing this structure supports your child to feel safe and protected and that their needs are understood. Caring for children can be both rewarding and challenging as well as very demanding. If you’re finding parenting a challenge you can contact:

- Health Visitor and GP
- Local Children’s centre
- Nursery staff

There are a range of organisations that provide services for children and families. You should be concerned if your child is:

- Being very withdrawn
- Being unresponsive
- Showing signs of behavioural problems
- Having delayed speech, poor language and communication skills

Your Health visitor can offer you direct advice as well as refer you to specialist services.

Remember

Each child is unique and there is a very wide range of what is seen to be “normal” development
The Child Psychotherapy Trust publishes a leaflet series called ‘Understanding Childhood’, which expands upon some of the information presented in this booklet.

**NHS 111**

**NHS 111 is a new service that’s being introduced to make it easier for you to access local NHS healthcare services. You can call 111 when you need medical help fast but it’s not a 999 emergency. NHS 111 is a fast and easy way to get the right help, whatever the time.**

You should use the NHS 111 service if you urgently need medical help or advice but it’s not a life-threatening situation.

**Call 111 if:**

- You need medical help fast but it’s not a 999 emergency.
- You think you need to go to A&E or need another NHS urgent care service.
- You don’t know who to call or you don’t have a GP to call.
- You need health information or reassurance about what to do next.

For less urgent health needs, contact your GP or local pharmacist in the usual way.

For immediate, life-threatening emergencies, continue to call 999.

The NHS 111 service is staffed by a team of fully trained advisers, supported by experienced nurses. They will ask you questions to assess your symptoms, then give you the healthcare advice you need or direct you straightaway to the local service that can help you best. That could be A&E, an out-of-hours doctor, a walk-in centre or urgent care centre, a community nurse, an emergency dentist or a late-opening chemist.

Where possible, the NHS 111 team will book you an appointment or transfer you directly to the people you need to speak to. If you need an ambulance, one will be sent just as quickly as if you had dialled 999.

If a health professional has given you a specific phone number to call when you are concerned about your condition, continue to use that number.
Caring for the people of Birmingham

**Disclaimer**

This guide is a pilot document which is in development. If you have any specific questions about any of the common childhood illnesses, you should consult your doctor or other professional healthcare provider. You should never delay seeking medical advice, disregard medical advice, or discontinue medical treatment because of information in this guide.

We welcome your feedback on how useful you found this document. Please email your comments or suggestions for future improvements to cmcsu.design@nhs.net
